The Medical Issue

Medical work is a strong and ever-growing sector of our design work at Hoch Associates. Our effectiveness in the field of medical design stems from a combination of vast experience, education, and staff expertise. Our projects require continuous evaluation of design and understanding of medical equipment, code and technology, and with each experience we grow sharper and more apt in this field of work. We have been growing in this way since our firm's beginning in 1992, and our momentum surges now as it never has before!

Awareness

The medical design field, like most other fields, has been deeply effected by the challenge to conserve energy of late. At Hoch Associates, we are innovating our design practices in order to maximize potential energy conservation. Below are listed some of the principles crucial to the design of "green" hospitals, excerpted from *The Green Guide*.

Following are some of the criteria that *The Green Guide* used to assess its top green hospitals.

Siting: Was the hospital sited with consideration for alternative transportation, storm water management, urban redevelopment and reducing any impact on the surrounding environment?

Water Efficiency: Is the hospital water-efficient, taking advantage of landscaping, water use reduction and innovative waste water use?

Energy and Air Pollution: What has the hospital done to reduce energy consumption and atmospheric pollution, including chlorofluorocarbon (CFC) reductions, renewable energy, reduced energy consumption, green power and reducing ozone?

Materials and Resources: Does the hospital use recycled building materials and resources (such as water), local materials or certified wood?

Indoor Environmental Quality: What has the hospital done to improve indoor air quality through increased ventilation and incorporating low-VOC paints, adhesives and materials to avoid offgassing of formaldehyde, toluene and other carcinogenic compounds? What steps have been taken to create comfortable temperatures and to enhance daylighting?

Healing Gardens: Does the hospital have healing gardens where patients, staff and visitors can reflect, relieve stress and reconnect with nature? Are there green roofs? Does the landscaping use native plants, which reduce water consumption and the use of pesticides?

Featured Project:

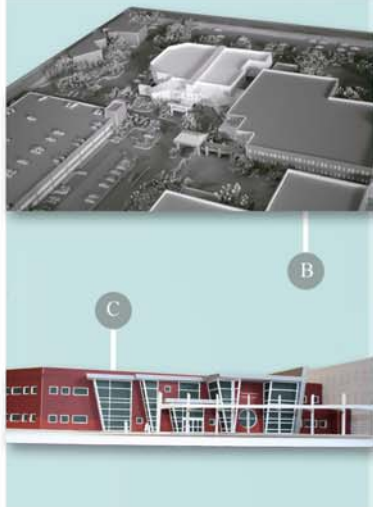

Comprehensive Cancer Care Center At Lutheran Hospital

It is with pride and excitement that we take on this assignment! To design Indiana's new, state-of-the-art Cancer Treatment Center is a contribution from us of attention to detail and the significance of the rare opportunity that it is to create an environment that comprehensively envelopes the needs of Cancer patients and families at such a trying time in their lives.

The ground-breaking which took place in mid-April, signified the first physical steps made toward completion. The Cancer Center will exceed 48,000 s.f., housing Fort Wayne Medical Oncology and Hematology, a Cancer Resource & Treatment Center, a surgery center, the Leukemia Society, and various tenant spaces. When designing such an environment for such specific and sensitive functions, certain principles are at the forefront of concern. It requires a high level of understanding and experience with these principles to produce a project of this significance that incorporates all of the needs of each and every user of the created environment.

We were chosen to design the Cancer Center due to our aptitude for such careful and sound practices in medical design and are honored to do so!

- A** Preliminary Sketch: A helpful tool for graphic visualization.
- B** Schematic Physical Model: A helpful tool for site and physical visualization of the Cancer Center in relation to the site.
- C** Design Development Physical Model: A step further in the process, closer to exemplifying the finished product.
- D** A 2-D Rendering of the intended Comprehensive Cancer Care Center.
- E** A Partial Floorplan: The step in the design process that coordinates intent with practicality and technicality.
